It is important to note that the model is not a perfect fit for the data. The model is based on the assumption that the data is normally distributed, which is not the case for the data in this study. The data is skewed to the right, which means that there are a few high values that pull the mean to the right. This is why the mean is higher than the median. The model is also based on the assumption that the data is independent, which is not the case for the data in this study. The data is correlated, which means that the values are not independent of each other. This is why the standard error is higher than the standard deviation. The model is also based on the assumption that the data is stationary, which is not the case for the data in this study. The data is non-stationary, which means that the mean and variance are not constant over time. This is why the standard error is higher than the standard deviation. The model is also based on the assumption that the data is normally distributed, which is not the case for the data in this study. The data is skewed to the right, which means that there are a few high values that pull the mean to the right. This is why the mean is higher than the median.
